

HANDY CHIP for cordless computer mice

Inside these mice not only intelligent electronics is hidden; they also hide “invisible” impulses such as wireless frequencies usually using 2,4 or 2,7 Gigahertz.

The advantages of cordless computer mice are, on a technical point of view:

reliability and stability.

We are sure that you are aware, how sensitive humans are, in particular with their hands and fingers. The Chinese medicine knows about since thousands of years. The fact, that lots of people feel tired and jaded after a long day with their computer work, might be attributed to different factors.

An underestimated one is related to the reflex zones situated in both palms; they exert on your health. As office clerk you clutch day after day “electricity” and not an instrument like a violinist.

Cordless computer mice communicate via Bluetooth using digitally pulsed frequencies. Electro-sensitive persons often feel this type of “electricity”.

Be it like a tingling in the hands and fingers or even a formication in one of the arms, you might consider using a normal computer mouse (with cable).

If you prefer using your cordless computer mouse, you can stick a **HANDY CHIP**® on the bottom.

BT CHIPS for cordless DECT phones

Since years digital cordless DECT phones conquered the households and bureau. Compared to the old-fashioned cord-phones they offer a lot of advantages.

However, both the station and the handsets radiate even through thick walls and cause a lot of electric smog.

As the already stated Bluetooth-systems, their radio waves are chopped in tiny little pieces (pulsed). On top of this, the station of all DECT-devices is regularly checking, if somebody is using the handset.

Around the clock the station transmits continuously pulsed radiation all through your home right up to your neighbors; and even if the handset is peacefully placed in the base-station.

The tachyonized and 24ct goldplated **BT CHIP's**® have been conceived to repolarize the electromagnetic radiation from cordless DECT phones.

Just stick den smaller one directly on the handset and the bigger one outside on the station.

HANDY CHIP for mobile phones

As already mentioned in the chapter [mobiles and cordless phones](#) it is a fact that since 1995 we are in possession of corresponding technology to influence in a positive way on the harmful radiation of mobile phones.

It might seem ambitious to dare making such statement, although many “scientific assertions” about this topic. They still pretend that mobile phones and mobile phone antennas are completely harmless. We let you decide the matter to take this information at face value.

Why don't you ask your kinésiologue and ask him/her to test the effects of electromagnetic radiation directly with on your body.

Why don't you just listen to your inner feeling: the answer should correspond to your sensations and not to any external statements. O.K. ?

Regarding this topic, so many books have been published in the past years; we will not expand on it in this leaflet. As the frequencies of the mobile phones did change within the last years we today offer the fourth generation of tachyon devices in order to harmonize the radiation of cell phones:

the 24ct goldplated **HANDY CHIP**®.

Invisible integration

The **HANDY CHIP**® has consciously been conceived to be applied in an „invisible“ manner. Thanks to its small dimensions (21 mm x 0,2 mm) he will fit even into the tiniest mobile phone. As you can see on the photo, you can apply it directly into the casing.

Please make sure that there is no direct contact with the integrated electronic components.

If you want, you can stick it directly on the battery or, if you regularly change your mobile phone, you can place it on the battery without sticking it.

Please make sure that there is no direct contact with the integrated electronic components.

By applying the **HANDY CHIP**® in and around the mobile phone a tachyon field is created. This energy field repolarizes permanently all the harmful radiation created by the phone.

Your whole organism will noticeable be discharged; well known symptoms are transformed more or less immediately.

Scientific studies

On our homepage www.biotac.ch we published several studies in the context of repolarization of harmful radiation emitted by cell phones by means of the tachyonized **HANDY CHIP**®.

HANDY CHIP for babyphones

Although most of the manufactures did accomplish a lot of claims from concerned parents, all of those devices still cause electric smog. Namely on three spots: the babyphone itself, the power adaptor and via the power cable.

Moreover most of the babyphones feature large ranges; in order to be assured that the baby can be heard even if the bed is one hundred meters away. This leads to the fact that the insensitivity is remarkably elevated.

In most of the cases not only the devices themselves are concerned but also the power cables. Despite the vast number of scientific debates and the search for reliable radiation limits it is certain, that even the weakest electromagnetic fields are know to affect in the long run on the health.

Furthermore a lot of physician suspect that babies and children more frequently suffer from leukemia if they are exposed in their bed to electromagnetic radiation.

We hope that we do not have to draw your attention to the fact than not only babyphones underlie to electric smog !

The solution is so easy and so cheap: Stick one of our **HANDY CHIPS**® on the receiver and another one directly on the transmitter ! Voilà. The explanation regarding health issues caused by electric smog is due to the effects on the pineal gland. This gland is controlled by weak electric impulses and produces the melatonin hormone, know as hormone of darkness. It regulates the day/night cycles.
